

# Whelen Command® CenCom Core® Fault Input

NEW FEATURE RELEASE • MARKET ADVISORY

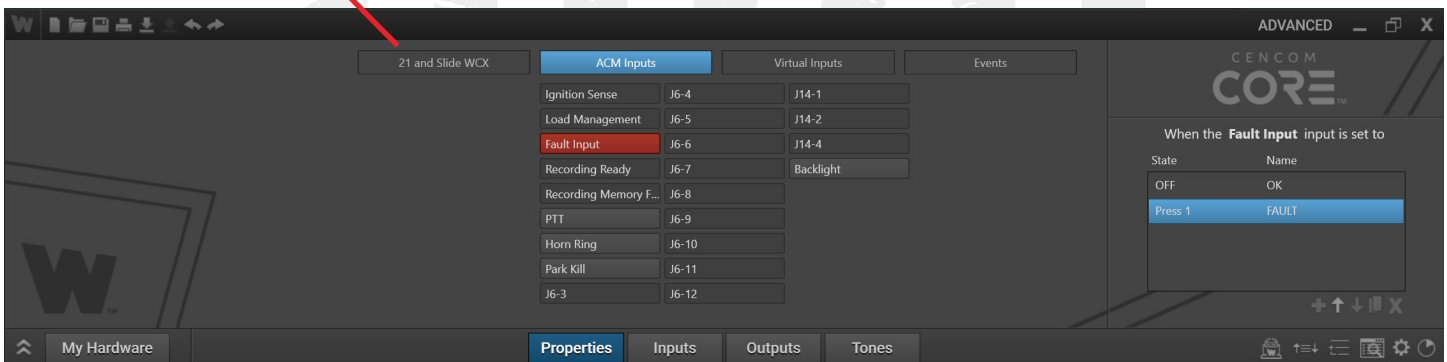

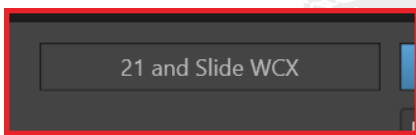

MA:0070 • 05/2024

A new time-saving feature is now available in the Whelen Command® software (Version 2.3.0.0) for Core™ control systems. The **Whelen Command CenCom Core Fault Input** empowers Core systems to send instant notifications when an output deviates from its standard operating range.

With programmable notification settings in Command, users can customize alerts such as activating a control head Traffic Advisor™ or playing a Digital Voice Message (DVM) tone through the in-cab speaker.

Previously, output failures were detected manually by physically inspecting a vehicle, but now if an output fault occurs notification is immediately sent to the vehicle operator, saving time, enhancing efficiency, and ensuring optimal performance.

Please note this feature only supports CenCom Core control systems and NOT Core Control Points.
